

Forestry shovel *Inforest*

It is the main tool used for opening and extending lines of defense, excavating, and removing vegetation. It allows to clear up to mineral soil stopping fuel supply and the spread of fire. It is also widely used for prescribed burns, burnouts, control of secondary seats of fire, and mopping up operations.

MATERIALS

The **Forestry Shovel** is made up of a heart-shaped forged steel blade with self-sharpening edges due to its geometric characteristics. These shovels are manufactured to meet the regulations of the U.S. Forest Service.

The baked paint finish provides protection and durability against wear and heat; and the blade has a tread to press with the foot without the risk of damaging the sole of the shoe with the hot blade.

Its **wooden handle** with a shape that ensures a firm grip preventing slipping makes it easier to work in confined spaces reducing fatigue and injuries in the hands.

Weight: 2,3 kg.

Length: 1,2 mt.

Handle: wood
